Nucleus DARK UI with Atom Syntax and Homebrew theme. Installation ready to install? You can install via apm: apm install platformio-ide-terminal or go to the installation tab in atom settings view, and search for platformio-ide-terminal. Flatpak caveats some Atom installations across flatpak may be incompatibility, including the inability to find host system binaries from selected directories, such as /usr/*⁶. If you experience problems using terminalplatformio-ide-with flatpak, such as lost binaries, which are normally accessible from the path you set in the shell of your choice, or if you are not able to change the directory to some directories, you may be affected. You can confirm this by searching for rfsnobody permissions from the root of your disk. You can solve this solution by installing another version of atom that is not inside a sand container. See here for full details. Using platformio-ide-terminal stays at the bottom of your editor while working. Click on the status code to switch that terminal (or ctrl-). Right-click the status code for the list of available commands. From the right-click menu you can color icon status as well as hide or close the terminal instance. Terminal you can open the last active terminal with platformio-ide-terminal:switch command (default: ctrl-). If terminal instances are not available, create a new instance. The same switch command is used to hide the currently active terminal. From there you can start typing at the terminal. By default, the station will change the directory to the project folder if possible. The default work guide in settings can be changed to the master directory or to the active file directory. See the commands below. Full station features each station With the default configuration files of the system. This ensures that you have access to the same commands and aliases as you would at your standard terminal. The features of the station have been loaded with several themes to choose from. Unsatisfied? Use the following template in the style sheet. platformio-ide-terminal.xterm (background color; Terminal label need a faster way to find out which station is which? The name of your status icons! Available via the status code context list. Color coding color code your status codes! Colors are customizable in settings, but color names remain the same in the context menu. Sort the organization of open terminal instances by dragging and dropping them. Resizing you can resize the view vertically, or just zoom it in with the Zoom button. You can set the default work guide for new stations. By default this folder will be the project. A file drop file will be dropped on the terminal to insert the file path into the entry. This works with external files, tabs from the Atom display tab, and entries from atom tree view. Insert the selected text insert and run the selected text from your text editor by running the platformio-ide-terminal:insert-selected-text-command (ctrl-enter). If you have specific text, the selected text will be inserted into and running in the active terminal. If you don't have specific text, the text will run on the line where the cursor is and then go to the next line. The quick command quickly inserts an order to your active terminal by executing the platformio-ide-terminal command:insert text. The dialog box pops up asking for an entry to insert. If you have the option to run the listed text enabled in settings (default is incorrect), platformio-ide-terminal automatically turns on the command for you. Support support for Special Keys for IME, dead keys, and other key combinations across the text insert dialog box. Just click the keyboard button at the top left of the terminal or set up a key map to the platformio-ide-terminal: insert the command text. Note: Make sure that you have to turn on the insert-switch command off otherwise it will run your listed text. Set the terminal to set stations for each file or folder you work on for the automatic switch of the terminal. The Toggling file folder option open automatic new terminal (to set the terminal) will have to set the creation of a new terminal automatically for files and folders that do not contain a terminal. The switch is located directly under the map stations option to. Keybind default action commands the ide terminal platform: new create a new terminal instance. ctrl-shift-torcmd-shift-f platformio-ide-terminal:toggle switch another active terminal instance. Note: This will create a new station if i. ctrl-(Control + Backtick) platformio-ide-terminal:prev Switch to the left terminal of the last active terminal. ctrl-shift-jorcmd-shift-j platformio-ide-terminal: The next switch to the right of the last active terminal. ctrl-shift-korcmd-shift-k platformio-ide-terminal:insert-selected-text run as an order in the active terminal. ctrl-enter platformio-ide-terminal: Insert text bring sentry box to use IME and special keys. - Ide Terminal Platform Platform: Full-screen switch full-screen active peripheral. - Platform-ide-Terminal Close the active terminal. ctrl-shift-xorcmd-shift-x platformio-ide-terminal: All stations are closed. - Platform-ide-Terminal:Renaming the active terminal. - Fork from Jeremiramini/Station Plus. Download and install the official GitHub's Atom Text Editor. PlatformIO will be installed as its extension. Open Corn Pack Management (Linux, OS - menu: edit > preferences > install, Windows - menu: file > settings > install) find the official Platformio-ide package install platformio IDE Intall clang Linux: using package managers: apt-get clang installation or yum clang installation. Mac OS X: Install the latest Xcode with the latest command line tools (installed automatically when clang is turned on at the terminal for the first time, or manually by running xcode-select -Windows Installation: Download Clang 3.9.1 for Windows. Clang 3.9.1 for Windows (64-bit) please do not install CLANG 4.0. Temporary PLATFORMIO only supports CLANG 3.9. If you see a failure to find msBuild toolsets error in the installation console, please ignore it and press any key to close this window. PlatformIO IDE only uses a Clang completion engine that must then work without any problems. Click the PlatformIO Home button on the PlatformIO toolbar. In choosing the board choose WeMos D1 R2 & Mini (WEMOS), the frame should be arduino. Open the .ini file and paste lib_deps = ITTioT to the end of the work line. lib_deps inform PlatformIO about which libraries to download for your project. ITTioT library is a must have with all lot homelab group software. The exact libraries required for each module are described on their example page. Open the main file.cpp in the src folder. Here's where you'll write your code. Now just replace everything with the relay example code. Run Build (PlatformIO > Build) and you should see the green success as a result in the build panel to load the firmware to the download run panel. After you have successfully downloaded the code, you may want to check how it works. To do this, try sending orders with MQTTbox. (If you have download problems with Linux, try sudo chown username/dev/ttyUSB0) to run an embedded serial monitor Choose (menu: PlatformIO > Serial) or The corresponding icon in the PlatformIO toolbar
